RStudio

John Muschelli

January 4, 2016
“RStudio is an integrated development environment (IDE) for R.”
It helps the user use R.
R, in essence is just the a console that takes commands from you typing into it
Is NOT dropdown statistical tools (such as Stata)
Snapshots taken from http://ayeimanol-r.net/2013/04/21/289/
RStudio/R Console

- Where code is executed (where things happen)
- You can type here for things interactively
- Code is **not saved** on your disk
RStudio/R Script/Rmarkdown files

- Where files open to
- Have R code and comments in them
- Can highlight and press (CMD+Enter (Mac) or Ctrl+Enter (Windows)) to run the code
- Code is saved on your disk
Workspace/Environment

```r
# load libraries of packages
library(languageR)
library(lme4)
library(ggplot2)
library(rms)
library(plyr)
library(reshape2)
library(psy)

# plotting demonstration
p <- ggplot(mtcars, aes(wt, mpg))
p + geom_point()
```

```
Attaching package: 'plyr'
The following object is masked from 'package:misc':
  is.discrete, summarize

> library(reshape2)
> library(psy)

Attaching package: 'psych'
The following object is masked from 'package:misc':
  describe
  The following object is masked from 'package:ggplot2':
    %>%

> p <- ggplot(mtcars, aes(wt, mpg))
p + geom_point()
```
Workspace/Environment

- Tells you what **objects** are in R
- What exists in memory

History

- Shows previous commands. Good to look at for debugging, but **don’t rely** on it as a script. Make a script!
Other Panes

- **Files** - shows the files on your computer of the directory you are working in
- **Viewer** - can view data or R objects
- **Help** - shows help of R commands
- **Plots** - pretty pictures
Other Panes - packages

- **Packages** - list of R packages that are loaded in memory
  - Packages are a set of functions written by R users
  - We write packages - some are good, some are not so good
- Think of them as “R Extensions”
- If they extend R, when you download R from CRAN, we (and others) refer to things as “base R”
  - We will show you how to do some things in base R, but also show you some newer (and more intuitive) ways to do things
  - You need base R, however, because when you Google for answers, they are commonly answered without any additional packages.
Hadey Wickham

- Previous Assistant Professor of Statistics at Rice University
- Writes many R packages
- One authority on all things R
- Employee and Developer at RStudio
- I (John) trust almost all his packages
  - How to trust an R package:
    http://simplystatistics.org/2015/11/06/how-i-decide-when-to-trust-an-r-package/
